

# Project 2 Notebook

Introduction (40 points)

- 10 points for background on the protein/gene/species of interest and where the data is sourced from

## Introduction

- 10 points for specific, measurable, and clear scientific question

## Scientific Question

When examining dog breeds (*canis lupus familiaris*), will breeds of a similar size (e.g. Cocker Spaniel, English Cocker Spaniel) have more related genes and SNP's surrounding longevity than breeds of a different size (e.g. Doberman Pinscher, Miniature Pinscher)?

Note: I only selected 6 genes most closely associated with life span (HMGA2 , IGF1 (done) , IGSF1 (too big), IRS4 (too big), LCORL (done), and SMAD2 (too big) ). There are more genes involved in this, but these are the most significant.

Note: Size will be determined by the AKC. You can filter by all AKC recognized dog breeds by size. This is categorical data; if it is easier for me to work with numerical instead, I will instead use the ideal height and weight, as outlined in the official standard of each breed.

:when possible used regions by paper if regions too big used dimension of genes on ncbi

- 10 points for clear, specific, and measurable scientific hypothesis that is in the form of an if-then statement

## Scientific Hypothesis

If you examine canine breeds, then breeds of a similar size (e.g. Cocker Spaniel, English Cocker Spaniel) they will have more related SNPs and or fragments of genes surrounding longevity than breeds of a different size (e.g. Doberman Pinscher, Miniature Pinscher).

- 10 points for description of what analyses were done and how the data was downloaded for the project  
## Analysis Performed: ### SNP's
- EDA: Scatterplots of SNP nucleotide vs size to check for visible trends before analysis
- Multiple Sequence Alignment (of SNP+border sequences), which was then visualized with `msaPrettyPrint()` \_ Clustering of MSA results, which were visualized as Dendrograms ### Gene Fragments:
- Multiple Sequence Alignment (of SNP+border sequences), which was then visualized with `msaPrettyPrint()` \_ Clustering of MSA results, which were visualized as Dendrograms ### Data Sourcing
- Dog breed information (sizing): American Kennel Club LINK \_ Data downloads:
- SNP and gene positionings:
- 25 points for definition of each of the packages loaded
- 5 points for correctly loading all of the packages needed

```
